

# Price Action Cheat Sheet

# Quasimodo/Over and Under

Price finds support or resistance  
Price breaks through that level, grabbing liquidity  
Price pulls back to retest, overshooting or undershooting  
Price then reclaims previous support/resistance  
Then we would enter the position

Bearish Quasimodos

# Ranges

1. Establish the range by marking where the majority of the swing highs and lows are, you want to mark the range high and low where the majority of points of contact are.
2. The Equilibrium or EQ is the 50% or halfway mark between the range high and low. You can use a fibonacci retracement tool for this by leaving only the 1, 0.5, and 0 left on. The EQ is not to be adjusted based on points of contact, it is always the 50% of the range.
3. One can trade ranges by buying near the bottom of the range and selling near the top. Stop losses can be placed either above the Peak High or Below the Peak Low or just outside the range as if price runs past these points it's likely the range will break.

# Flippin' Ranges

Macro Range High

## Flippin' Ranges Pattern

Micro Range Definition: impulse extension to first swing low/high (TraderMayne concept)

Untested SR Levels: range highs/lows that price has not revisited since breaking the range

Untested SR Behavior: Time + Space is key here. If not enough of either has passed since the level broke, it will be ignored when price revisits it. If sufficient Time + Space has passed, they become high probability bounce levels.

Trade Setup: mark off untested SR levels from previous ranges , then either 1) set orders at these levels in anticipation of SR flips, or 2) use them as take profit levels for existing positions.

Insufficient Time + Space to expect SR flip. Price rips right through and ignores this level completely.

Price fails to close above this untested SR level, confirming flip from support-->resistance

Macro Range High

Break of range high creates untested SR level (red)

Time + Space

Price revisited untested level after sufficient Time + Space. Bounce confirms SR flip from resistance-->support.

Micro Range Low

Macro Range Low

# *Top Down Analysis*

*Top Down Analysis pt. 2*

1. We already have in mind this is a potential bounce area due to H4 and D2 (2 day) bullish OB used to drive price up in the past

2. We wait for a break in our lower timeframe market structure near support establish on the higher timeframe

3. Once we have our shift in MS we wait for a retracement into out +OB on our lower timeframe chart  
OTE should be in line with our Order Block

4. We pull our fibs from swing low to swing high and shave off some of our profits at our fib targets (-0.272, -0.618, -1)

Our Daily directional bias remains bearish til we make a higher high, therefore, the idea behind this trade is a short term trade. Risk is higher when we trade against higher timeframe trend and this is why we wait for our retracement for a good entry on the lower timeframe

## Top Down Analysis pt. 3

break or shift in market structure happens here as we move above a short term high

Our initial entry

OTE confluence with +OB  
OTE = Optimal Trade Entry (61.8 - 78.6% retracement)

H1 + OB

Many traders might fear entering a long here since price fell so fast into this level. However, with an understanding of market structure and Order Block's we should take these opportunities with a stop loss just below

## *Consolidation under resistance*

BTC/USD, 60, COINBASE

# *Trading Spikes*

## *Break of Range*

Price consolidates into a range. contracts build up on both sides. Look to the higher time frame for a directional bias.

Break of range

support holds, time to go.

You can break the range into 3 parts. top (resistance), Bottom (support) and EQ (equilibrium).

How price consolidates around the EQ can help in some situations in determining if the consolidation is bullish or bearish.

When a range breaks up or down, It tends to throwback to the top of the range and or EQ. If it holds it will lead to more expansion.

# Three Stops

*Three stops*

@livercoinXBT

The ICT (Inner Circle Trader) Bullish Breaker is a PA (Price Action) concept that can be used to enter a long position.

# Breaker

## Criteria

- 1 - A swing low is formed, we assume sell stops are underneath
- 2 - A bearish OB (Order Block) is formed taking out the swing low and the stops
- 3 - Price blows thru the OB to the upside, the OB should provide NO resistance.
- 4 - Wait for price to retrace to the OB and buy it placing your stop below the OB
- 5 - Target old highs
- 6 - Profit

Target old highs

# Breaker

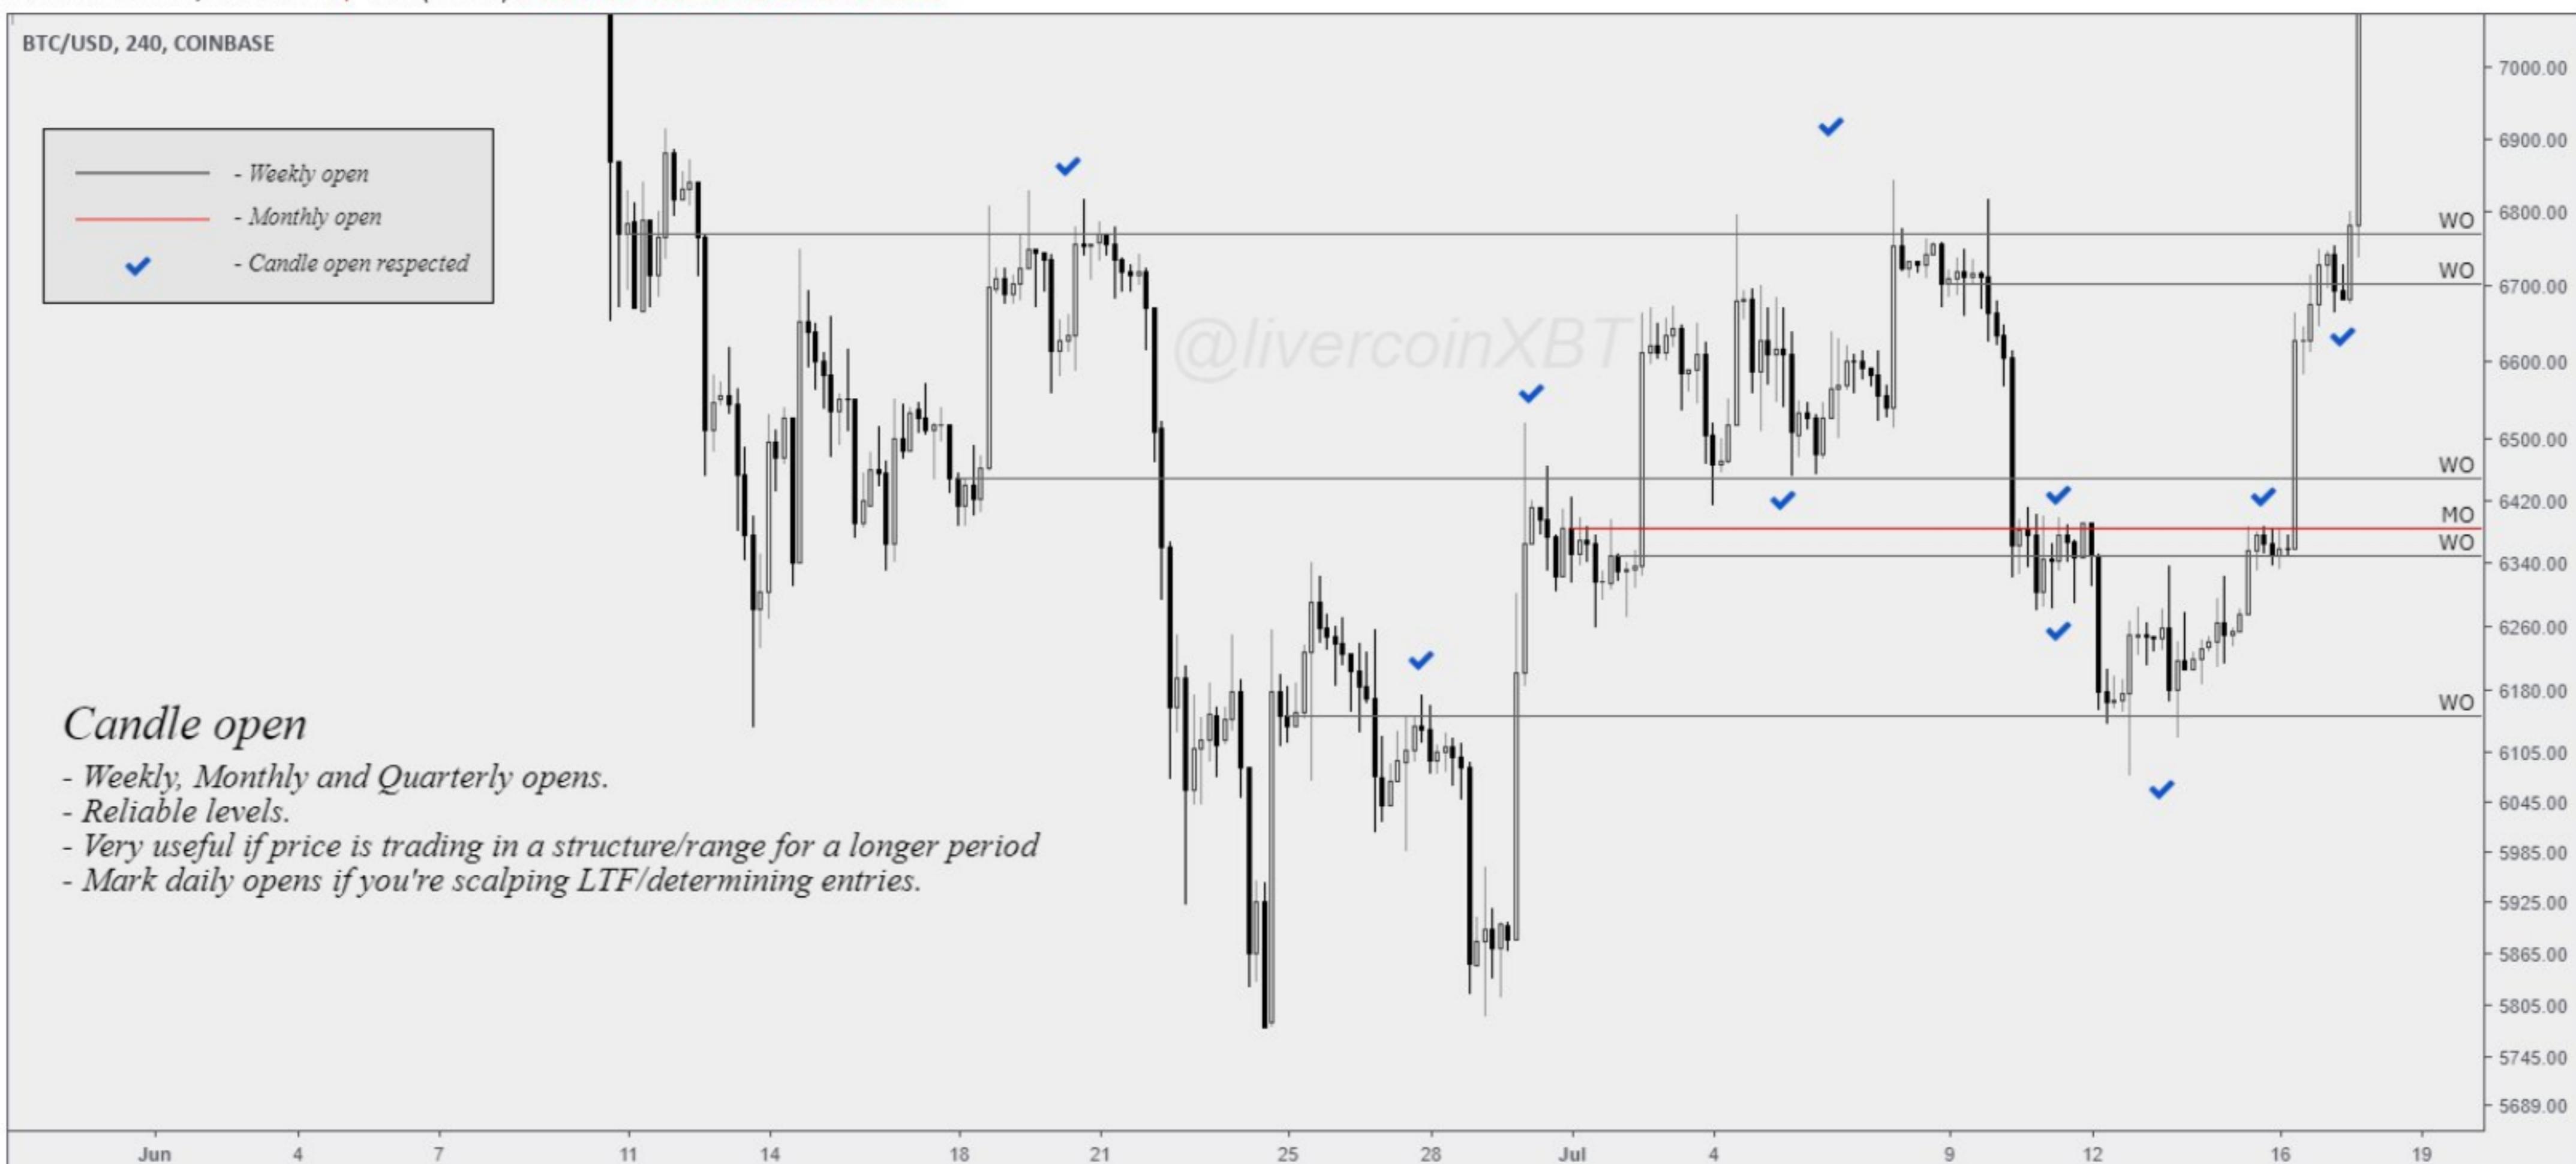

The ICT (Inner Circle Trader) Bullish Breaker is a PA (Price Action) concept that can be used to enter a long position.

## Criteria

- 1 - A swing low is formed, we assume sell stops are underneath
- 2 - A bearish OB (Order Block) is formed taking out the swing low and the stops
- 3 - Price blows thru the OB to the upside, the OB should provide NO resistance.
- 4 - Wait for price to retrace to the OB and buy it placing your stop below the OB
- 5 - Target old highs
- 6 - Profit

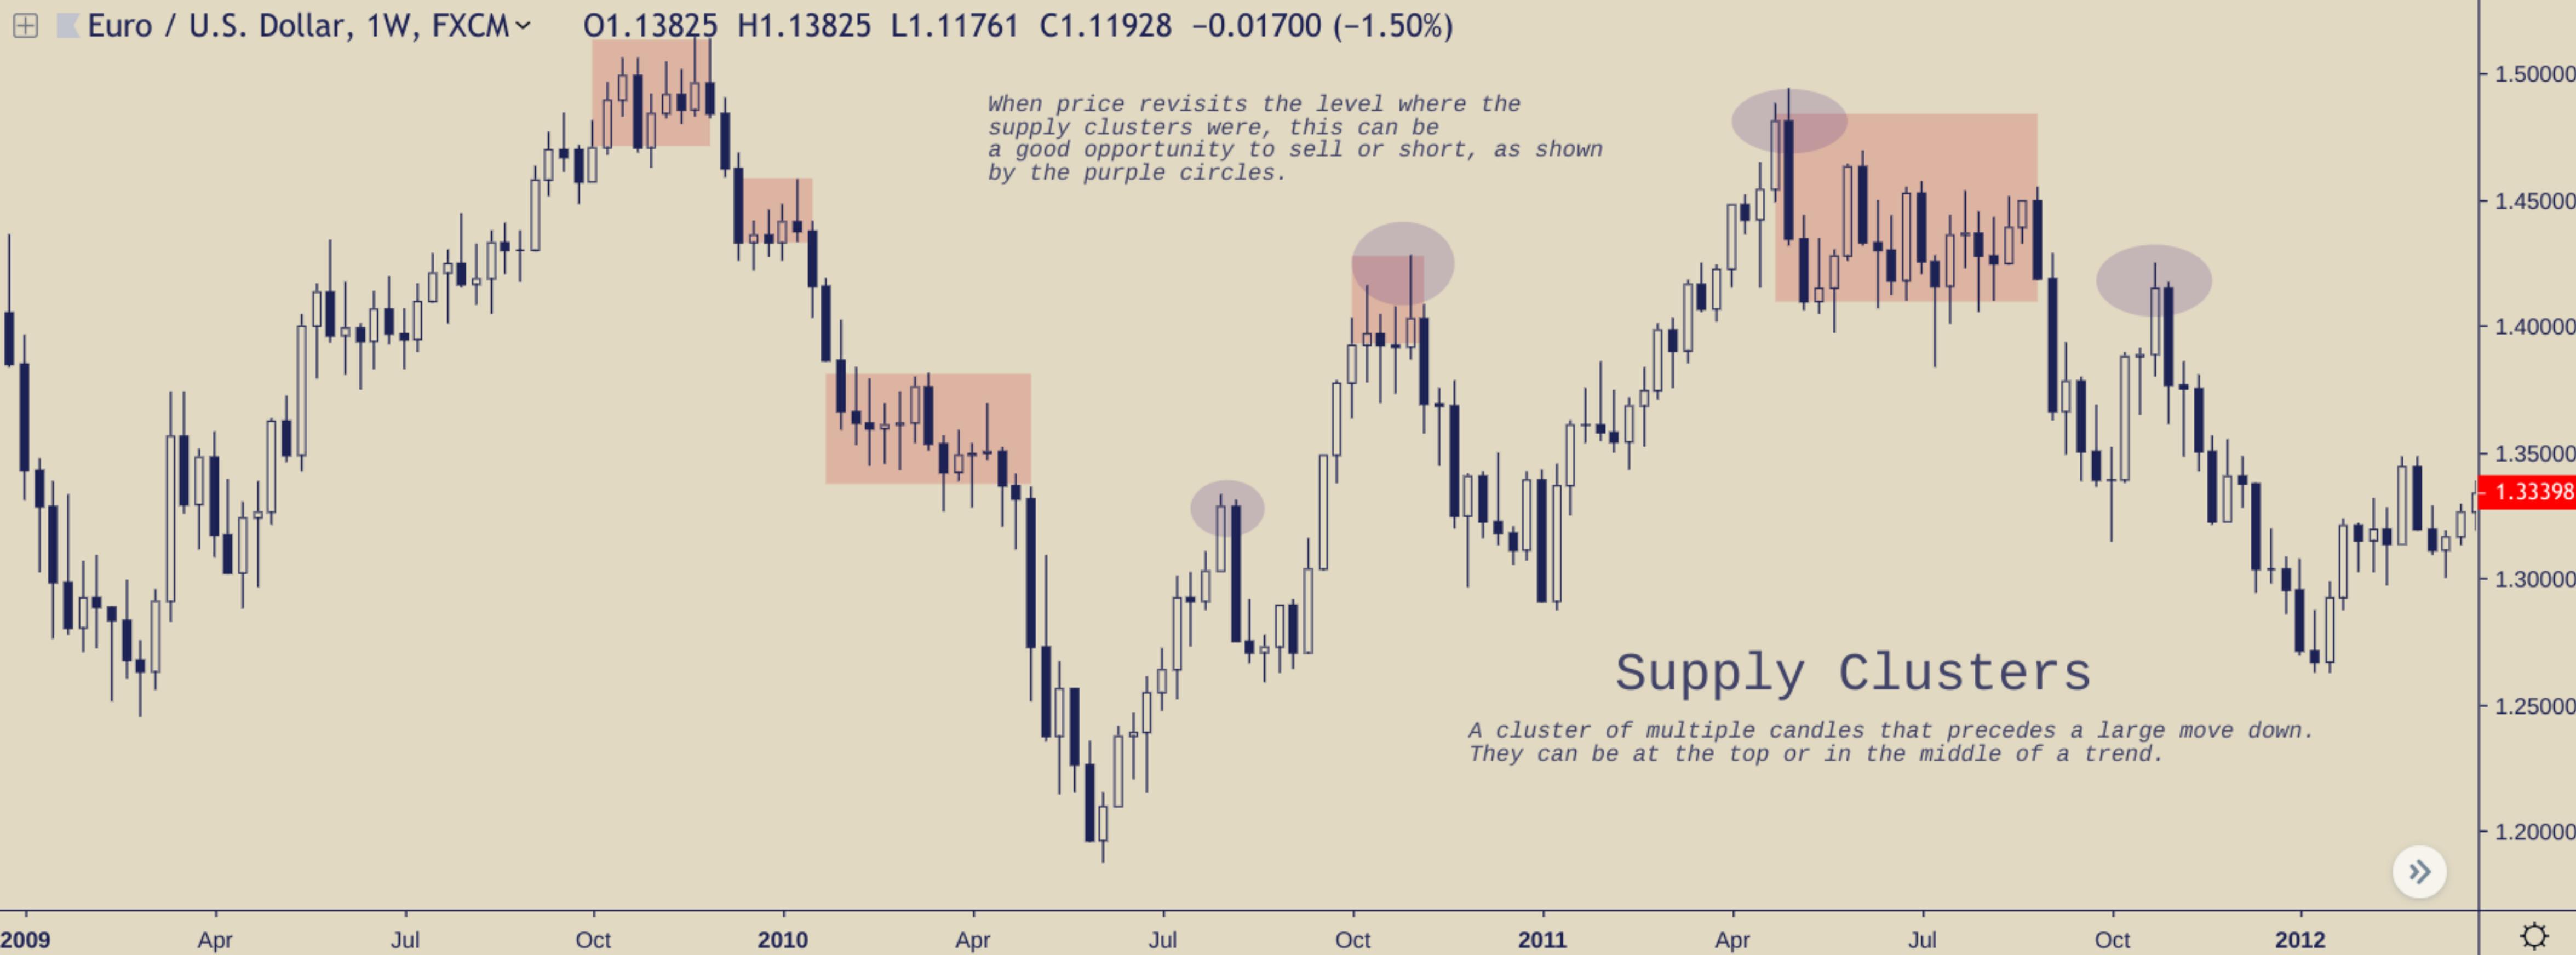

## Demand Clusters

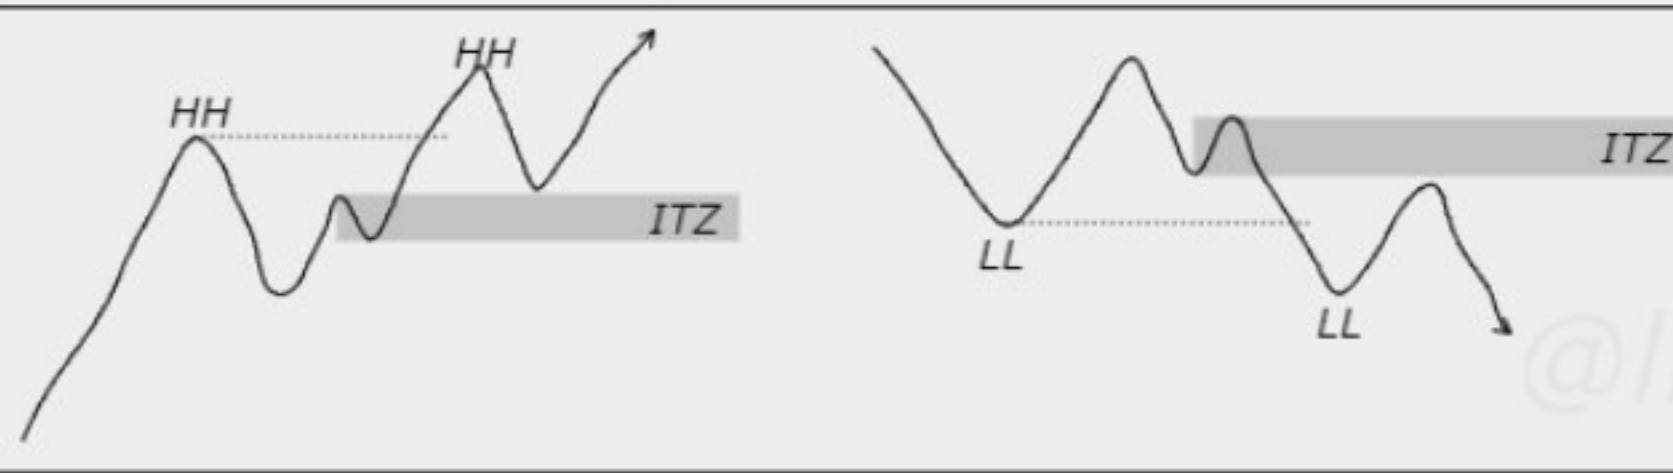

*A cluster of multiple candles which precedes a strong move up.  
They can be at the bottom or in the middle of a trend.*

Important trading zone - ITZ

In an uptrend : The last structure that led to a higher high is recognizable as an ITZ

In a downtrend : The last structure that led to a lower low is recognizable as an ITZ
